- [!\[\]\(767ddc536c5331f5333c7801240a378b_img.jpg\) twitter](#)

If you've worked at an agency for any significant amount of time, and particularly if you've been involved in forecasting, proposals or client pitches, you've likely been asked at least one of (or a combination or amalgamation of) the following questions:

1. 1) How much traffic can I expect to receive?
2. 2) How long until I see X amount of organic visits?
3. 3) What traffic will I receive from X investment?
4. 4) What organic opportunity is available within our industry?
5. 5) How much traffic do my competitors receive?

Forecasting is notoriously difficult, and done badly can be misleading or even damaging. There is a myriad of assumptions, caveats and uncontrollable factors that can mean that any predictions are nothing more than a ~~finger in the air~~ educated estimation. Organic forecasting is difficult enough to do, that writing about and explaining it would give me sleepless nights (Kirsty Hulse [wrote a better post](#) than I ever could on the subject), so I decided to focus on questions 4 and 5 of those listed above.

Imagine this very realistic (or even familiar) scenario; a client wants to know how much traffic their competitor receives, what the potential size and opportunity of their vertical is, and how to fulfil that potential by increasing visibility and acquiring more traffic. Before being able to accurately and insightfully answer the trickier final point there, it would be useful to know what you're competing against. Assuming you don't have access to your client's competitors' analytics data, it would be useful to get an idea of their organic performance, and ideally have confidence that the data you're looking at is at best solid.

Bounce Rate

28.41%

There are a number of really great visibility tools we use at Screaming Frog ([Searchmetrics](#) and [Sistrix](#) to name a couple of favourites), but these tools choose not to speculate on traffic, instead estimating visibility based on ranking position and keyword volume/value (which doesn't necessarily correlate to traffic). There are a number of traffic estimator tools which obviously do speculate on traffic, as well as some well-known SEO tools that have functionality or components within their suites that do the same, which got us wondering a few things:

- How accurate are traffic estimator tools?
- Do they generally under or overestimate traffic?
- Are there types of websites where their estimations are more accurate than others?
- Are there potential reasons behind this under/overestimation?
- Are there potential learnings for search marketers?

The Test

We wanted to put their accuracy to the test, so here's what we did:

1) We took organic visit data for a range of 25 websites we have access to via Google Analytics, for the months of February, March and April 2016 (January can often be an outlier for many websites, so we just selected the most recent 3-month period of relative stability). We looked exclusively at *UK organic traffic only* (generally, but not exclusively the 25 sites selected are primarily UK focused, but some target multiple territories or even worldwide), because some of the traffic estimator tools segment traffic by region, and don't always cover every territory. Similarly, not all the tools we used in the test deal especially well with subdomains, so we selected root domains in our analysis.

2) While we can't disclose the websites selected, to ensure as even a test as possible within what is a fairly small sample size, we specifically selected sites that covered a range of verticals, target audiences and purposes (more on that breakdown to come). For the same reason, we also selected sites that covered a range of different traffic levels, from those which receive millions of organic visits each month, to those with just hundreds of visits. We hoped this varied selection might show trends where certain tools are more or less accurate at estimating certain types of websites' traffic levels.

3) We analysed these 25 websites using 3 tools – [SimilarWeb](#), [Ahrefs](#) and [SEMrush](#). We recorded organic traffic estimate numbers for each of the 25 websites, focusing on exclusively UK traffic to match up with our GA data.

4) We measured actual traffic against estimated traffic for each of the 3 tools. We measured this in a number of different ways –

- Visits difference for each site using each tool.
- Percentage of visits difference for each site using each tool.
- Overall visits difference for each tool.
- Percentage of visits difference for each tool.
- Average percentage difference for each tool.

Predictions

9/24/2019*

How Accurate Are Website Traffic Estimators? | Screaming Frog

Before sharing the results I'll share my one real prediction; the tools would almost certainly underestimate organic traffic. This is because these traffic estimator tools have limited indexes and only track a certain amount of keywords, so can't possibly expect to completely accurately estimate traffic. Most don't handle the long tail well as they simply don't have the keyword bandwidth to do so. Furthermore, the tools, much like standard forecasting CTR modelling, also assume visit numbers by ranking position of keyword volume – they *don't* consider keyword intent, brand vs non-brand, Google answer boxes, 9-pack & 7-pack results, the Knowledge Graph etc.

You can [access the data here](#).

The Results

- Overall the most accurate tool analysed was SimilarWeb which on average overestimated organic traffic by 1%. It overestimated total visit numbers by 17%, estimating 15.7m visits for the 25 websites, compared to the 13.4m actual. SimilarWeb was the only tool to generally overestimate traffic. Ahrefs was the next most accurate, underestimating total traffic for all sites by 17% (11.1m estimated visits compared to 13.4m actual visits), and on average underestimating traffic by 36% percent. We found SEMrush to be the least accurate tool, underestimating total traffic for all sites by 30% (9.4m estimated visits compare d to 13.4m actual visits), and on average underestimating traffic by 42%.
- The site with the highest actual traffic ('Charity 1', 8.8m actual visits) was wildly differently estimated by the three tools; SimilarWeb – 12m estimated visits (+36%), Ahrefs – 8.1m estimated visits (-8%), SEMrush – 6.4m estimated visits (-37%). Generally speaking, Ahrefs was the most accurate tool for estimating traffic of high traffic websites.
- The most underestimated websites for each tool were: 'Charity 1' by SEMrush (2.4m visits difference), 'Health' by SimilarWeb (725k visits difference), and 'Health' by Ahrefs (957k visits difference). The largest percentage underestimation was 'Energy' by Ahrefs, which underestimated traffic by 94%. The most overestimated websites for each tool were: 'Travel 1' by SEMrush (132k visits difference), 'Charity 1' by SimilarWeb (3m visits difference), and 'Travel 1' by Ahrefs (198k visits difference). The largest percentage overestimation was 'B2B Products' by SimilarWeb, which overestimated traffic by 128%.

Further Analysis

- All three tools significantly underestimated traffic to 'Health', all by at least 500k visits. This site receives a lot of traffic from longer tail location specific phrases, most of which won't likely have been picked up by the tools. Generally, the most accurately estimated sites were e-commerce, but there were many more of this type of site than any other. The most accurately estimated site across all three tools was 'Ecommerce 7', on average just 2% under actual traffic levels.
- 'Travel 1' was significantly overestimated by Ahrefs and SEMrush, by 72% and 48% respectively. Anecdotally, the site in question competes well for visibility in very competitive search results that are dominated by big brands, but they themselves are not an established brand at all. This high overestimation confirms that despite good visibility, the site in question isn't getting sufficient clicks from the search results, due in part to a lack of brand presence.
- Generally, sites with lower traffic levels were less accurately estimated. There were three sites with under 10k organic visits ('Insurance 1', 'Travel 2' and 'B2B Products'), and almost every estimation by each tool was at least 40% incorrect (either over or under). Only SimilarWeb got close to estimating traffic for 'Travel 2', underestimating by 6%.

Final Thoughts

Our test is by no means a thorough mathematical or scientific experiment, merely a quick test to try and gauge the accuracy of such tools. There are a number of ways we could improve or increase our test, including but not limited to:

- Increase the number of traffic estimator tools analysed.
- Increase the number of websites analysed.
- Use more precise analytical data (GA numbers tend to always come with a pinch of salt).
- Use an even number of website type (or analyse just a single vertical and website type).
- Increase the number of territories to US, Europe or worldwide.

Our rather limited test is just the tip of the iceberg, but has hopefully shown that all traffic estimators have strengths and weaknesses, and their level of accuracy can vary quite considerably.

Dixon Jones 3 years ago

Interesting. It would also be interesting to report the standard deviation between the three sets. This would help to understand the spread of inaccuracy. The data to do that is on all in the article, but as the data is in image form, it's a ball ache to turn it back into data. Any chance of doing that?

[Reply](#)

o [Patrick Langridge](#) 3 years ago

Cheers Dixon. Have updated the post to include a link to the data (<https://docs.google.com/spreadsheets/d/1GeGsD5p7s57kM1Os8aFwgYNWZxnfRAV3eNs8o7rUy64/edit#gid=0>) which was even more of a ball ache to try and embed!

[Reply](#)

o [Tony Spencer](#) 3 years ago

I love this analysis though I do wish you had thrown in one more competitor to SimilarWeb since they are collecting much different data than SEMRush and Ahrefs: Compete.com.

9/24/2019

How Accurate Are Website Traffic Estimators? | Screaming Frog

Since SimilarWeb and Compete are direct competitors and run rather expensive API's it would be nice to know which horse to pick for that real user data.

[Reply](#)

o [Patrick Langridge](#) 3 years ago

Thanks Tony! Hadn't heard of Compete.com but it looks really cool. I'll investigate!

[Reply](#)

o [CM](#) 2 years ago

From the compete.com website:

Thank you from the Compete team

As of December 31, 2016, Compete.com and the Compete PRO platform have been shut down. It has been an honor and pleasure to serve you over the past 15 years and we thank you for your patronage. It's our sincere hope that our data and services have helped you to grow your business.

Thank you for your support, The Compete team

[Reply](#)

o [Juan Gonzalez](#) 3 years ago

Hi Dixon, Hi Patrick,

thank you very much for this useful data Patrick!

If my calculations are correct, then the standard deviations are as follows: SEMrush 26%, SimilarWeb 30%, Ahrefs 23%. Is it correct?

Greetings from Germany to the UK and I hope to see you again, soon.

Juan

[Reply](#)

o [Patrick Langridge](#) 3 years ago

Thanks Juan, that looks correct to me!

9/24/2019

Cheers,
Patrick

[Reply](#)

Pavel Matveev 3 years ago

Hi Patrick,

My Name is Pavel, i'm Product Owner at SEMRush.

Thank you for your research, it definitely gave us some food for thought. We are constantly working on improving quality of our product.

But, to be honest, results, which you got within this research are prove that it's incorrect to operate by absolute numbers which all of tools are provide.

The main purposes of such tools are: See trends, compare performance, spy on competitors' strategies.

So,

- The data should be considered as a snapshot of a constantly changing environment.
- if you compare two competing websites – then their relative performance can be judged very accurately.

Best regards,
Pavel

[Reply](#)

Patrick Langridge 3 years ago

Hi Pavel,

Thanks for your feedback. Completely agree with you, as mentioned in the post it was my expectation that absolute numbers wouldn't match, this was just a test to see how close each tool was.

Thanks,
Patrick

[Reply](#)

Arnoud 3 years ago

Very interesting research!

These are indeed questions we get a lot from current and new SEO clients and are quite difficult to answer. This method and the use of these tools make it a bit more easy and mostly more reliable to predict traffic opportunity.

Like you mention, this is just tip of the iceberg and further research would be nice. Though I also hear from experts that Similarweb is the best for this purpose.

Cheers,
Arnoud

[Reply](#) Jhon 3 years ago

There is another traffic estimator worth mentioning: <http://www.visitorsdetective.com/> I use it on a daily basis..

[Reply](#) Andrew 3 years ago

Patrick, great insight!

So, what would you recommend to use in the end? SimilarWeb, Semrush, Ahrefs?
Is it only for organic traffic? Are there any good tools for all traffic?

Thanks!

[Reply](#) Patrick Langridge 3 years ago

Thanks Andrew! We found that SimilarWeb is on average the most accurate, but all had varying degrees of accuracy across the board! Short answer; take them all with a big pinch of salt ;)

[Reply](#) Theodor 3 years ago

Great test Patrick! You made me go and test out all three tools against Google Analytics for the three websites I manage, I also used WordPress stats. The websites are for SMBs that operate in specific niches so they don't get tons of traffic. The differences were almost 50% for Ahrefs and SW, while SEM Rush gave no results (which I attribute to the small amount of traffic for the websites). WordPress stats were the same as GA.

[Reply](#) Patrick Langridge 2 years ago

Thanks Theodor, interesting to hear about your experience and comparisons too!

[Reply](#)

Ulrik Sandholt 2 years ago

I think it is an interesting analysis which verifies that these tools are largely useless. I do not care if the average is within a 20% accuracy, but if I can rely on whether it estimates one website accurately or not. With any of these tools I have no clue whether it is -50% or +100%, which means it is useless. That I see agencies and other companies out there using these tools for anything is beyond me. What is the value in a number that is completely wrong to anyone, but someone who charge money to find it?

Reply

Patrick Langridge 2 years ago

Thanks Ulrik! I agree that it's frustrating that the tools aren't always super accurate, but to be fair to them, they don't claim to be exactly accurate in terms of these measurements. They are principally to show trends and patterns, to give users a rough overview of site performance. I agree though, that in some cases the seem to be way off!

Reply

Macalyn 2 years ago

These "Metrics" and or "analytical" oriented sites are useless! None of them are accurate! I tried about 4 different kinds and one said my site was down in traffic, another said it was up in traffic, one said that my traffic was about 22K per month, another said it's 1.6k, then the other said it's 5000. I mean which is it?! The insights from within my Bigcommerce website, seem the most accurate with my google analytics..so I feel that Google Analytics is my best bet for checking how my most popular landing pages are doing, it even tells me where people click the most. All these other sites are useless. Why do we have so many of these sites now? Probably because anytime we feel the info is false, we look to another that will give us the answer, don't get me started on Alexa..

Reply

Sinoun 2 years ago

I know I'm a little late here, but thank you for this! I've been pulling out my hair trying to figure out the best tool. I'll have to give SimilarWeb a try. Thanks!

How Accurate Are Website Traffic Estimators? | Screaming Frog

Great article. The last few days I have been trying to find out traffic from different sites usings SEMRush and SimilarWeb and it seems that results from SEMRush is under estimated and from SimilarWeb it is way over estimated . No doubt, it's all a crapshoot and we just have to roll the dice on which tool we think we benefit us the most.

[Reply](#)

Kim Sanderhoff 2 years ago

To me the average value has no real value. Let's take Similarweb for instance. So by adding up the negatives and positives you end up getting 1%. But in fact overestimating is just as bad as underestimating. I would be much more interested in the delta values. From my calculations Similarweb on average was wrong by 37% (unless I made a typo when putting it in my calculator).

[Reply](#)

Patrick Langridge 2 years ago

Thanks for that Kim, really useful. Looking forward to your own study on this, do let me know when it goes live.

[Reply](#)

Kim Sanderhoff 2 years ago

There's no need for a new study. I'm not discrediting the work you put behind this either. I'm simply pointing out that the average value alone is not very helpful. If one were to only look at the average values, he would conclude that Similarweb is roughly 40 times more accurate than Semrush, which really isn't the case.

Based on your numbers the delta values are: Semrush = 48.6% Similarweb = 37.4% Ahrefs = 42.2%.

[Reply](#)

CM 2 years ago

Thank you for putting these data together as is is interesting to have a reflection on real results and estimated ones. Nonetheless, it is statistical nonsense to calculate an average percentage of wrong. Important considerations like "is estimated traffic accuracy linked to higher or lower traffic of a site" are missing.

And be aware of, for the individual website it makes a huge difference if it is 50 % over or under reported. This may make or brake a biz.

[Reply](#)

Bartosz Góralewicz 2 years ago

Great article Patrick! One thing that I would improve is methodology. If SimilarWeb is usually wrong by ~30 – 130% we can't say that it's accuracy is 1%. I think that once you consult somebody with a background in methodology/statistics, you will see results that are even more interesting.

Reply

Pawel Sokolowski 2 years ago

Thanks Patric.

Found this article during research for traffic prediction methodology. I would say all these data sources are similar.

I calculate average error margin based on Your data and here are the results:
SEMRush 48%, SimilarWeb 37% and Ahrefs 42%.

According to small data sample is difficult to predict how accurate these metrics are, but You can use GA benchmark to know a little more about averages for vertical and compare this data with external sources.

Great work on comparison table, thanks.

Interesting and thanks for sharing Patrick! But do you know that even GA would not be the best source for us to know the actual traffic. Since they always over showcase the “actual visits” to a higher number compare to the actual visits from our web server end..

Reply

Patrick Langridge 7 months ago

Thanks Martin! Yeah that's correct, obviously GA will also sample data so never completely accurate.

Reply

Bryce 5 months ago

Hi Patrick,

Thanks for diving into this topic. It's worth noting that with SEMrush and Ahrefs it's not possible to get estimates without giving up some of your personal information or starting a free trial. Similarweb will give 6 months for free but it is nearly impossible to get an account for longer durations (and incredibly expensive if you are lucky enough to be chosen).

Website IQ (<https://www.websiteiq.com/>) offers 9 months of free website traffic estimates (desktop only) without signing up for anything (really free). The site has 8 years of traffic data that is available with an inexpensive subscription.

[Reply](#)

Steve 4 months ago

Hi Patrick,

the averages maths doesn't checkout, as both overestimates and underestimates are inaccuracies. By simply calculating the average you are cancelling negative inaccuracies with positive inaccuracies. Looking at similar web, it's NOT the case that the tool is only 1% inaccurate on average.

For example Similarweb was 1% accurate only 1/25 times. Which means it is inaccurate 96% of the time. To compare accuracy, in this case, I'd have thought to use the mode vs. the mean. I'm sure someone else (probably more advanced in statistics! can offer a better insight).

Thank you for uploading the raw data! Looking at the tables, it shows that all the platforms are talking utter nonsense!

Steve

Guillaume 4 months ago

Thank you for the study, surprisingly there's not a lot of those out there.

From my experience, those tools are best use to benchmark similar competitors and are not as interesting once you start comparing traffic across audience segments (localization/industries/etc).

Find Out How Much Traffic a Website Gets: 3 Ways Compared

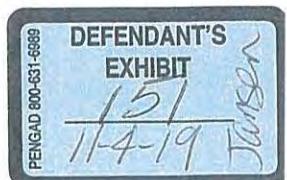

Joshua Hardwick (<https://ahrefs.com/blog/author/joshua-hardwick/>) August 16, 2018

1.5K shares 21 Comments (https://ahrefs.com/blog/website-traffic/#disqus_thread)

Do you want to see how much traffic a website gets? There are a few different ways to do this.

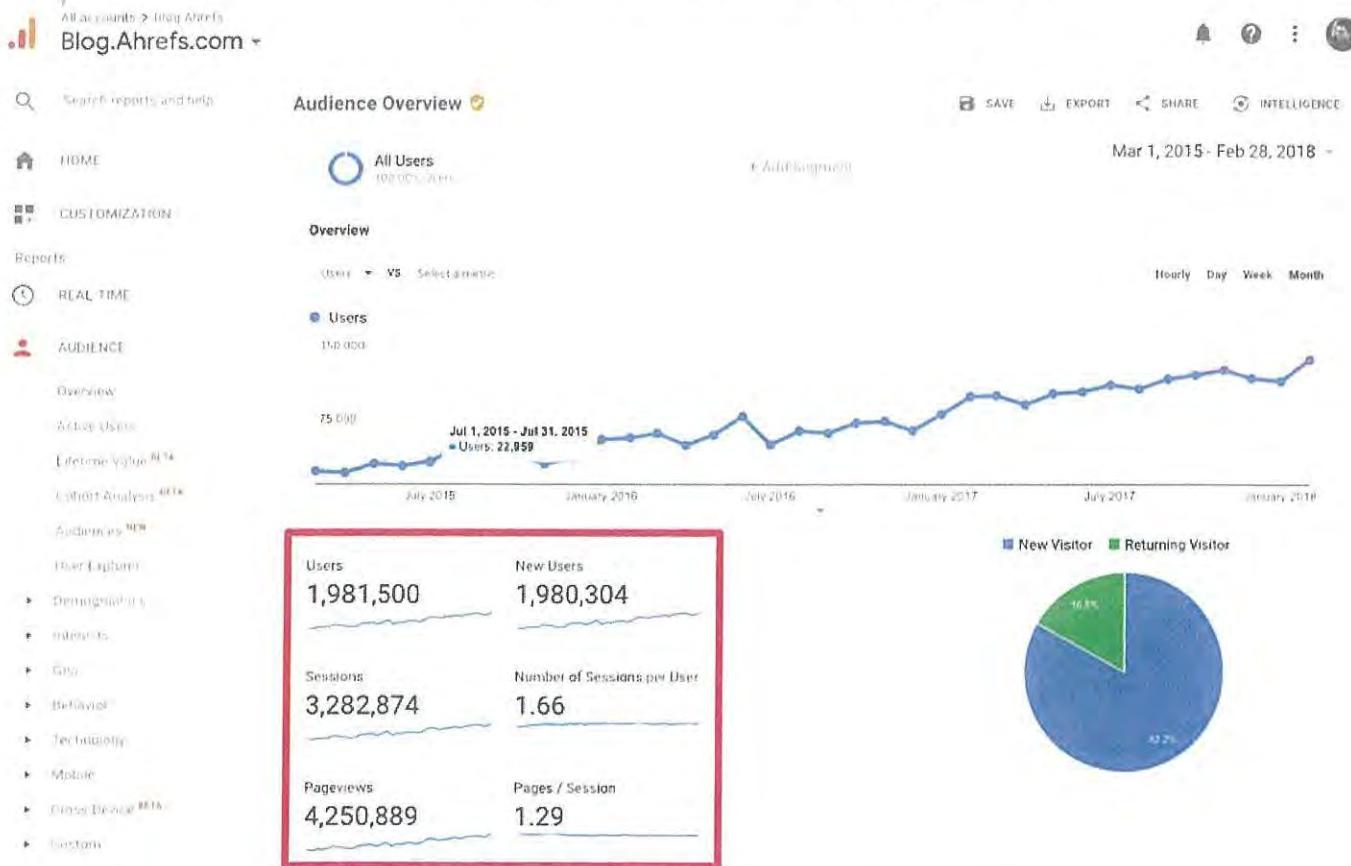

Before I get to those, though, here's an important point:

If you own the website, there's no need to estimate. You can install Google Analytics (<https://analytics.google.com/analytics/web/>) (for free) and see close to exact traffic numbers.

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Ahrefs' blog growth (<https://ahrefs.com/blog/increase-blog-traffic/>), via Google Analytics

SIDENOTE. Server log file analysis can provide even more data about your traffic, as explained in this article (<http://www.analyticsmarket.com/blog/google-analytics-vs-log-files>).

But as you're reading this article, I'll hazard a guess that you don't own the website in question, right?

You're probably trying to guess how much traffic your competitor gets, and it's unlikely that they'll share their Google Analytics with you.

In this post, I'll run through **three** ways to get traffic estimates for any website.

Method 1. Use a traffic estimation tool

There are two types of traffic estimation tools:

- Tools that estimate total traffic:** Visitors to your website can come from all kinds of places: search engines; forums; social media; etc. These tools estimate the total amount of traffic from *all* sources.

225

1259

in

2. **Tools that estimate only organic traffic:** Most websites get a good chunk of their traffic from search engines like Google; this is called “organic traffic.” Estimates from these tools don’t take into account traffic from any other sources (e.g., social media) besides organic traffic.

Let’s explore each of these in more detail.

1. Find out how much traffic a website gets in total

Here at Ahrefs, we tried all the leading **total** traffic estimation tools and did a few small internal experiments to find out which was most accurate, and SimilarWeb (<https://www.similarweb.com/>) won.

SimilarWeb shows a bunch of traffic-related stats, including:

- Total visits;
- Pages per visit;
- Average visit duration;
- Bounce rate

SIDENOTE. Learn more about how Similarweb defines and calculates these metrics here (<https://support.similarweb.com/hc/en-us/articles/212999769-Total-Visits>), here (<https://support.similarweb.com/hc/en-us/articles/360000802405-Pages-Visit>), here (<https://support.similarweb.com/hc/en-us/articles/115000501485-Avg-Visit-Duration>) and here (<https://support.similarweb.com/hc/en-us/articles/115000501625-Bounce-Rate>).

Here are the traffic estimates for *ahrefs.com* as of July 2018:

225

1259

in

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Strangely, it doesn't provide pageview estimates. But these can be reverse engineered by multiplying *total visits* by *pages per visit* (for us, this would be 5.63M * 7.5 = 42.23M pageviews).

Free users can also view monthly traffic estimations for up to six months on an interactive graph.

Total Visits ⓘ

On desktop & mobile web, in the last 6 months

Paying subscribers can see this data for up to two years.

All traffic estimates include both mobile and desktop traffic, and you can segment by device category if you're a paying subscriber.

Scroll down, and the report shows some more useful traffic-related stats such as *traffic by countries (desktop only)*...

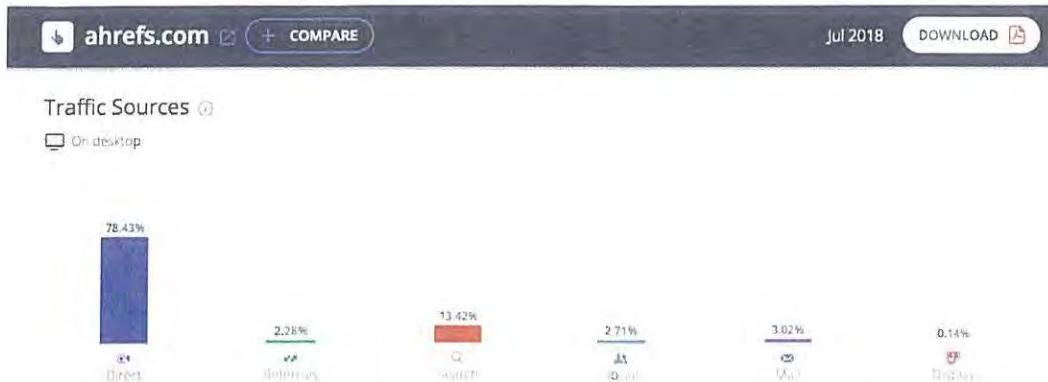

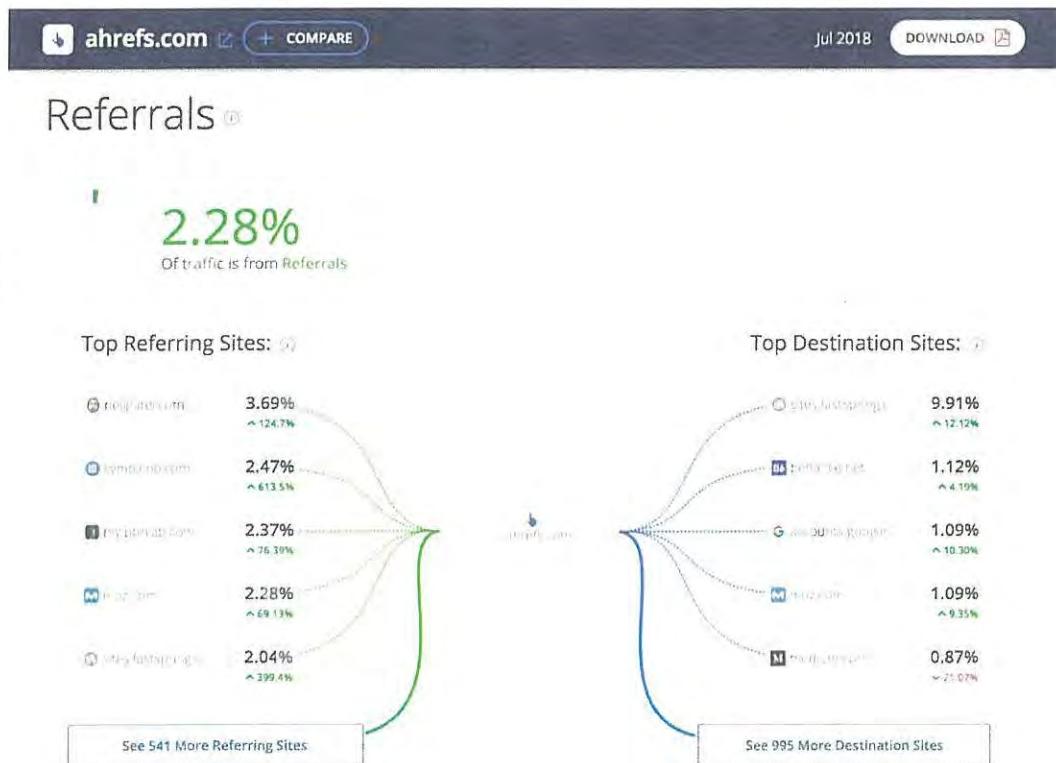

SIDENOTE. Free users can only see stats for the top 5 countries that drive the highest percentage of traffic.

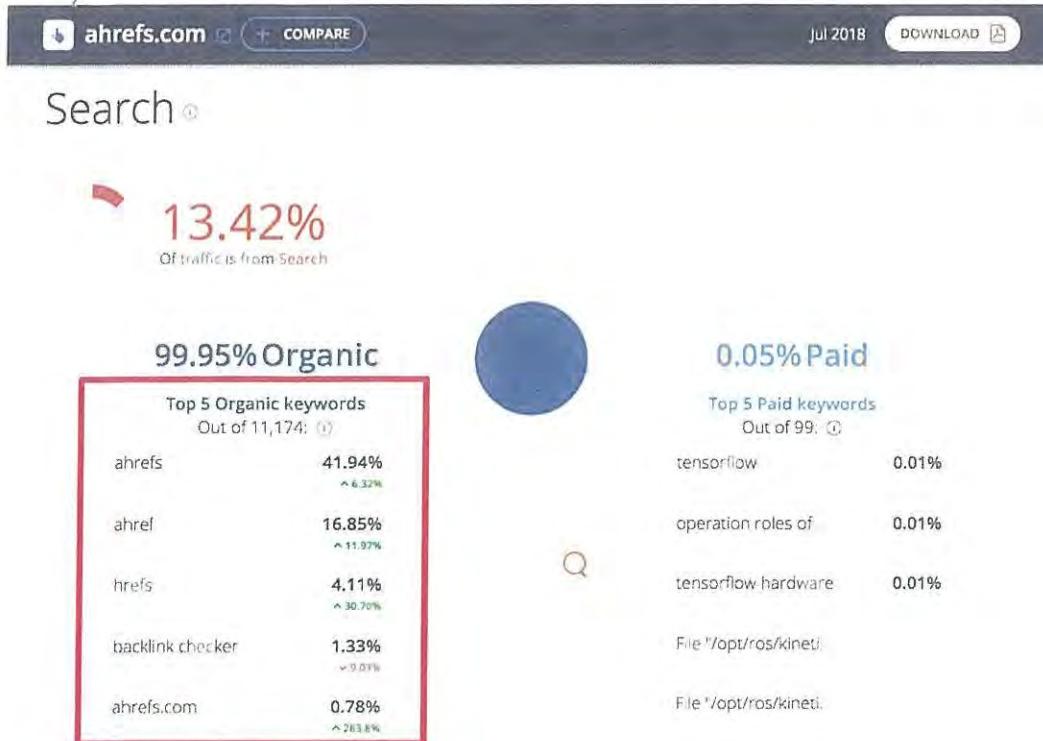

225

1259

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

... traffic sources (direct, referrals, search, etc)...*... top referring sites (this is useful when building links (<https://ahrefs.com/blog/link-building/>) or looking for guest post opportunities (<https://ahrefs.com/blog/guest-blogging/>) that will bring referral traffic!)...**... and top 5 organic keywords...*

Where does the data come from?

To understand the reliability of this data, it's vital that we know where it comes from.

Here's what SimilarWeb has to say (<https://www.similarweb.com/ourdata>) on the matter:

Our data comes from 4 main sources:

- A panel of monitored devices, currently the largest in the industry;
- Local internet service providers (ISPs) located in many different countries;
- Our web crawlers that scan every public website to create a highly accurate map of the digital world;
- Hundreds of thousands of direct measurement sources from websites and apps that are connected to us directly.”

Translation: SimilarWeb get their data from a variety of sources which collect anonymized information about users' online activity.

They don't say how big their coverage is, but they don't get information from everyone in the world. So their data is derived from a relatively small sample of the “online population.”

Is the data accurate?

Let's test it. Here's what we did:

1. Took a sample of 116 websites from Flippa;
2. Pulled **total** unique visitors and pageviews from Similarweb for all 116 sites;
3. Compared them.

SIDENOTE. We only used websites from Flippa that were at least one year old and had verified traffic (<https://support.flippa.com/hc/en-us/articles/202470444-How-Can-I-Verify-my-Traffic-Stats->).

Here's what we found:

SimilarWeb overestimated **total unique visitors** for 91.67% of the websites.

SimilarWeb overestimated **total unique visitors** by 308.81% on average;

SimilarWeb overestimated **total pageviews** for 70.83% of the websites;

SimilarWeb overestimated **total pageviews** by 210.58% on average.

To summarise, SimilarWeb tends to drastically overestimate actual unique visitors and pageviews, according to our testing. But it doesn't always overestimate things; it underestimates unique visitors roughly 1/12th of the time, and pageviews between $\frac{1}{3}$ and $\frac{1}{4}$ of the time.

But here's a critical point:

SimilarWeb only showed estimates for roughly $\frac{1}{5}$ of the sites we tested.

For the other $\frac{4}{5}$, here's what we saw:

The screenshot shows a 'Traffic Overview' section. On the left, there's a cartoon illustration of a character looking through binoculars. A red arrow points to a red-bordered message box containing the text: 'We're sorry but... We currently lack sufficient data to show competitive estimations for this website. Rest assured, we are working tirelessly to provide the world with the most reliable data about every website and every app. If you are the owner of stockguru.com, you can connect your site's Google Analytics to present your data on SimilarWeb.' Below the message is a blue button labeled 'CONNECT THIS WEBSITE'.

No data. Nada.

225

f 1259

in

If you're wondering why this happened, it's probably due to the size of the sites we tested. All of them were relatively small sites from Flippa.

You'll remember that SimilarWeb calculates their estimates based on data from a small subset of the entire online population. So if they don't show traffic estimates for a particular site, it's because not enough people in the subset from which they derive their data have visited the website in question.

That's why SimilarWeb tends to have less or no data on smaller sites.

To prove this, we looked at whether or not SimilarWeb gave estimates for the top 100 sites in the world (<https://ahrefs.com/ahrefs-top>), according to Ahrefs Rank (<https://ahrefs.com/blog/seo-metrics/#section3>). SimilarWeb gave estimates for *all* of them.

Back to the data:

Because SimilarWeb only gave traffic estimates for roughly $\frac{1}{5}$ of sites, all our findings are based on a sample size of just 24 websites. This is admittedly rather small.

You should, therefore, take our findings with a massive pinch of salt.

2. Find out how much traffic a website gets from search engines

It's true that there are a few organic traffic estimation tools on the market. But we're clearly biased towards our tool (Ahrefs (<https://ahrefs.com/>)) and convinced that it has the best quality data.

Here are the traffic-related estimates we give you:

Estimated monthly visits from Google (worldwide);

Estimated traffic value (i.e., the equivalent cost of monthly organic traffic for the website or URL if bought via PPC);

Estimated number of keywords (in the top 100) that the website ranks for in Google.

Let's look at the traffic estimates in Ahrefs for *ahrefs.com* (*how meta!*), as of July 2018:

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Ahrefs: Competitor Research Tools & SEO Backlink Checker
ahrefs.com

Overview

Backlink profile

Backlinks

- New
- Lost
- Broken

Referring domains

- New

Ahrefs Rank: 3,176 UR: 85 DR: 87 Backlinks: 2.87M
 Recent 3.69M Historical 23.6M

Referring domains: 21.9K
 Recent 25.4K Historical 50.1K

Organic keywords: 87.0K Organic traffic: 270K Traffic value: \$649K
 PPC 0/0

You can see that *ahrefs.com* gets an estimated 270,000 monthly visitors from Google.

This is a “live” traffic estimate, meaning that it’s a “rolling average.” It gets adjusted each time we update the pool of keywords for which the website ranks in our database. Because of this, traffic estimates can vary slightly from day to day. This number includes both desktop and mobile traffic.

DO YOU WANT TO SEE TRAFFIC ESTIMATES FOR A SUBSECTION OF A WEBSITE?

Just paste any subdomain or subfolder (e.g., *ahrefs.com/blog* or *blog.ahrefs.com*) into Site Explorer (<https://ahrefs.com/site-explorer>). Select the “Prefix” option from the drop-down.

ahrefs Dashboard Alerts Site explorer Content explorer Keywords explorer Rank tracker

http + https ▾ ahrefs.com/blog

Prefix

For example, if you enter *ahrefs.com/blog*, you see the total sum of search traffic across all pages within the “/blog/” folder, like so:

SEO Blog by Ahrefs - Link Building Strategies & SEO Tips
ahrefs.com/blog

Ahrefs Rank: 3,167 UR: 32 DR: 87 Backlinks: 39.7K +688
 Recent 70.5K Historical 162K

Referring domains: 4.97K
 Recent 5.74K Historical 8.56K

Organic keywords: 61.1K +4K Organic traffic: 106K +11K
 PPC 0

If you want to look at the traffic to each page within this folder, use the **Top Pages** report. It will show a list of pages sorted by traffic (from high to low).

9/24/2019

225

f 1259

in

Bottomline: Ahrefs kicks back tons of data for almost any website or URL. But how?

Where does the data come from?

Ahrefs' estimates are based on ranking data from our database (<https://ahrefs.com/big-data>) of 6.1 BILLION keywords.

This database is updated monthly, including the search volume estimates (check out a few fun search stats from last month here (<https://ahrefs.com/blog/top-google-searches/>))

Here's what we do to calculate traffic estimates in a nutshell:

1. Take all the keywords for which a website ranks;
2. Check monthly search volume, ranking position, and click-through rate for each keyword (across 170 countries);
3. Estimate how much traffic the site gets from each keyword;
4. Sum up these numbers to estimate the total organic traffic a site receives.

You can learn more about exactly how we calculate this number here (<https://help.ahrefs.com/ahrefs-terminology/site-explorer/how-accurate-is-ahrefs-organic-traffic-metric-and-how-do-we-calculate-it>).

Is this data accurate?

Let's test it. Here's what we did:

1. Took that same sample of 116 websites from Flippa (all of which showed verified global organic search traffic numbers);
2. Pulled **organic** traffic numbers from Ahrefs for all 116 websites;
3. Compared them.

Here's what we found:

Ahrefs underestimated **organic unique visitors** for 74.14% of the websites.

Ahrefs underestimated **organic unique visitors** by 38.08% on average;

Ahrefs underestimated **organic pageviews** for 90.52% of the websites;

Ahrefs underestimated **organic pageviews** by 52.04% on average.

To summarise, Ahrefs tends to underestimate organic unique visitors and pageviews, according to our testing. But it doesn't always underestimates things; it overestimates organic unique visitors roughly 1/4th of the time, and organic pageviews roughly 1/10th of the time.

SIDENOTE. By the way, these findings are based on a larger sample size than our SimilarWeb data, because Ahrefs showed estimates for *all* 116 of the sites we tested. (Remember that SimilarWeb only gave estimated for roughly $\frac{1}{5}$ of them?)

But why does Ahrefs tend to underestimate traffic anyhow?

It's because we can only estimate traffic from the 6.1 BILLION keywords we have in our database (<https://ahrefs.com/big-data>). Sound like a lot? It is, we have the biggest database of all similar tools on the market.

But even a database of 6.1B keywords isn't enough to hold every possible search query that one could type into Google. That would be impossible.

For example, a lot of people perform super long-tail searches (<https://ahrefs.com/blog/long-tail-keywords/>)...

show me the best list of protein powders in the world please Google

... which we don't have in our database and, therefore, can't estimate the traffic from.

This is how all organic traffic estimation tools work, so we're not alone here. They all tend to underestimate traffic. The degree to which this happens comes down to the size of their keywords database; the bigger it is, the more accurate their traffic estimations will be.

This is why it matters that we (Ahrefs) have the biggest keywords database on the market.

It's also worth noting that no-one has totally accurate search volume estimations (<https://ahrefs.com/blog/keyword-traffic-estimation/>), not even Google. This is another reason that our estimates tend to be underestimations.

Which tool is best for comparing multiple sites?

Sometimes, it's not so much about estimating traffic with insane precision, but rather being able to compare the relative popularity of two or more sites.

225

1259

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

For example, imagine that you have a list of one hundred outreach (<https://ahrefs.com/blog/outreach/>) prospects, and you want to prioritize your outreach efforts starting with the sites that receive the most traffic.

In this case, you want to compare the sites to each other and rank them in order of traffic.

So which tool is best for doing this?

To learn that, we'll run a Spearman correlation (<https://geographyfieldwork.com/SpearmansRank.htm>) on our data.

Here are the results for SimilarWeb:

Actual “Unique visitors” VS SimilarWeb

Total visits

0.713

Actual “Pageviews” VS SimilarWeb

“PageViews”

0.779

... and Ahrefs:

Actual “Unique organic visitors” VS
Ahrefs “Global” organic traffic

0.767

Actual “Organic Pageviews” VS Ahrefs
“Global” organic traffic

0.784

Confused?

Here's what a Spearman correlation shows:

Spearman's Rank correlation coefficient is a technique which can be used to summarise the strength and direction (negative or positive) of a relationship between two variables. The result will always be between 1 and minus 1. Rank the two data sets.

Even more confused? Let me explain (with examples).

We're looking at the correlation between two sets of data: the “real” traffic numbers (set #1) and the estimated traffic (set #2). If the numbers **positively** correlate in any way, the Spearman correlation will be between zero and 1. If they **negatively** correlate, it will be between zero and -1.

f 1259

in

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

So, the closer the correlation is to 1, the more of a positive correlation there is between the two data sets.

Let's assume we have three websites with the following *actual* traffic...

Site1 — 100

Site2 — 5,000

Site3 — 40,000

... and Ahrefs reports the following traffic estimates...

Site1 — 50

Site2 — 2,000

Site3 — 10,000

... that would be a perfect positive correlation of 1. (*The “rank” of the corresponding numbers in each dataset have a perfect positive correlation with each other*)

But if Ahrefs estimated the traffic stats as follows...

Site1 — 10,000

Site2 — 2,000

Site3 — 50

... that would be a perfect negative correlation of -1. (*The “rank” of the corresponding numbers in each dataset have a perfect negative positive correlation with each other*)

So basically, the higher the correlation, the better the tool is for comparing two or more sites.

Looking at the Spearman correlation data above, you can see that both Ahrefs and SimilarWeb have a strong positive correlation with “real” traffic. But Ahrefs does trump SimilarWeb, marginally.

This means that should you use our Batch Analysis tool (<https://ahrefs.com/batch-analysis>) to obtain domain-level traffic estimates for a bunch of outreach prospects, then sort by traffic (high to low)...

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Domain/URL		Organic search

kinsta.com ▾	domain	107.178.240.207	233,307	305,796	
gooyaabitemplates.com ▾	domain	74.124.197.192	25,570	281,445	
themeisle.com ▾	domain	52.6.22.199	173,582	248,823	
ahrefs.com ▾	domain	151.80.39.61	80,449	246,945	
yoast.com ▾	domain	104.24.48.6	155,427	130,728	
backlinko.com ▾	domain	172.104.25.71	97,462	102,692	

...this is likely to be a pretty good judge of the relative popularity of these sites.

So which traffic estimation tool should you use?

It's important to note that each of these tools do different things.

SimilarWeb estimates **total** traffic, whereas Ahrefs estimates **organic** (i.e., Google) traffic.

One of the unique benefits of SimilarWeb is that you can see where the majority of traffic to a website is coming from (e.g., organic search, social, etc.):

9/24/2019

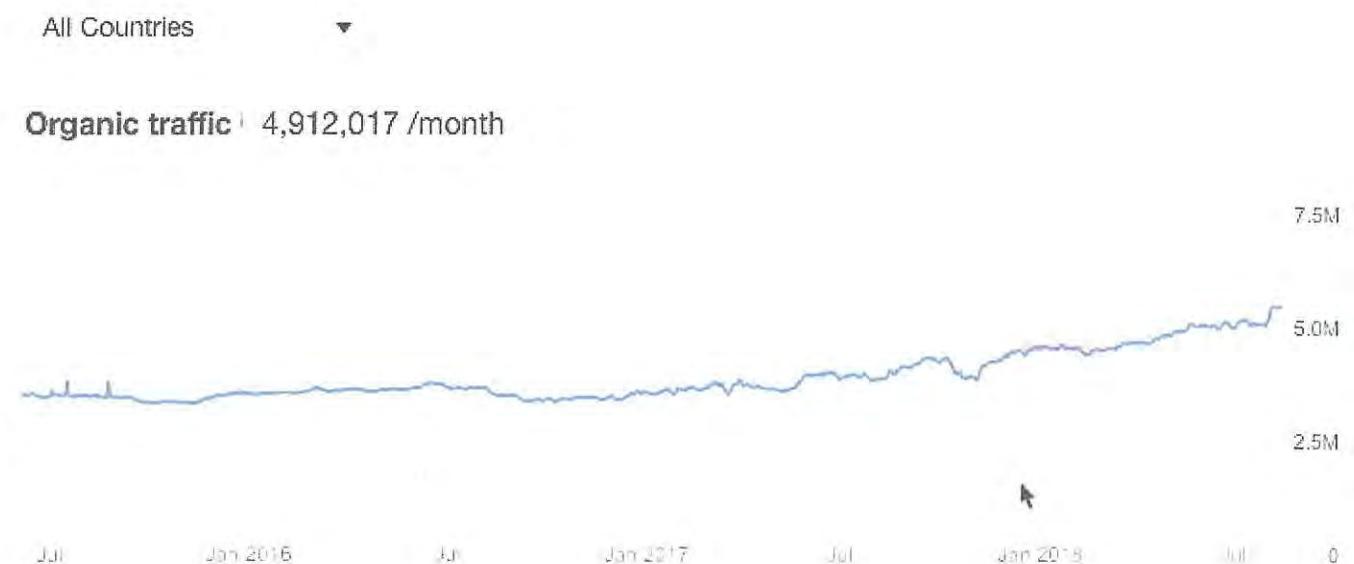

Find Out How Much Traffic a Website Gets: 3 Ways Compared

You can see, for example, that *thewirecutter.com* gets roughly 2/3 of its traffic from search engines, according to SimilarWeb.

Which brings us to a cool point:

If you see that a site gets a lot of traffic from organic search in SimilarWeb, you can use Ahrefs to dig deeper and better understand that traffic.

For example, in the case of *thewirecutter.com*, Ahrefs can show how organic traffic has grown over the past 3+ years...

... or every single one of the 3.1 MILLION keywords it ranks for...

Organic Keywords

Position	Volume	KD	CPC	Traffic	Word count	SERP features	All	Export
2,330,635	149,161	139,990	134,439	More				
Keyword	Volume	KD	CPC	Traffic	Position	URL	SERP	Upd.
wirecutter	137,000	18	1.20	50,984	1	thewirecutter.com/+	id	SERP ▾ 11 Aug
sweethome	37,000	39	0.70	20,384	1	thewirecutter.com/home-garden/+	id	SERP ▾ 11 Aug
think	99,000	22	0.40	14,071	3 1 1	thewirecutter.com/reviews/think-period-parties/+	id	SERP ▾ 11 Aug
the wirecutter	26,000	16	3.00	13,271	1	thewirecutter.com/reviews/+	id	SERP ▾ 11 Aug
best wireless headphones	82,000	49	0.60	12,454	3	thewirecutter.com/reviews/best-wireless-headphones/+	id	SERP ▾ 11 Aug

... or the pages responsible for bringing the most organic traffic to the site...

4	35,263	\$46,353	7,439 ▾	136	thewirecutter.com/reviews/best-vacuum-cleaner/	vacuum cleaner reviews	29,000	1

... and a whole lot more (<https://ahrefs.com/blog/how-to-use-ahrefs/>)!

But enough bragging! 😊 Let's talk briefly about pricing.

SimilarWeb don't publish pricing information on their website (<https://www.similarweb.com/corp/pricing/>). But this Quora thread (<https://www.quora.com/What-is-the-price-of-the-SimilarWeb-PRO-package>) puts their cheapest plan (which gives you access to only 6 months worth of traffic data) at \$199/month.

That's double the cost of our lowest plan (<https://ahrefs.com/pricing>). We also have a 7-day trial (<https://ahrefs.com/pricing>), whereas SimilarWeb offers no such thing.

But before you make a decision, let's take a look at a couple of other ways to find out how much traffic a website gets.

Method 2. Look for an “advertise with us” page

Most bloggers receive so many “*I'm interested in advertising on your site; how much traffic does it get?*” emails that it makes sense to publish this information on a publicly accessible advertising page.

Here's one such page from geekwire.com:

Reach

- >2M page views per month
- >1.2M unique visitors per month
- >67,000 followers on Facebook, Twitter & LinkedIn
- Events average >800 attendees

It states their monthly unique visitors, pageviews, and some other useful information (e.g., social stats). It's not just the big sites that do this, either; I've seen a lot of individual bloggers with similar pages.

But how do you find these pages anyhow?

The easiest way is with the following Google search (<https://ahrefs.com/blog/google-advanced-search-operators/>):

site:website.com advertise with us

Nine times out of 10, if they have such a page, it will be the first result.

A screenshot of a Google search results page. The search query is "site:geekwire.com advertise with us". The results show a single organic search result from "Advertise on GeekWire" with the URL "https://www.geekwire.com/advertise/". The snippet for this result reads: "Advertise on GeekWire, Seattle's leading technology news site, to reach the innovators, technology workers and entrepreneurs in the Pacific Northwest's tech ...".

site:geekwire.com advertise with us

All Images News Videos Maps More Settings Tools

About 20,300 results (0.53 seconds)

Advertise on GeekWire
<https://www.geekwire.com/advertise/>

Advertise on GeekWire, Seattle's leading technology news site, to reach the innovators, technology workers and entrepreneurs in the Pacific Northwest's tech ...

Not seeing traffic stats on the advertising page? See if there's a link to a "media pack;" a lot of sites include their traffic stats here.

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Site Statistics

- 850 current members
- 40,000 monthly searches for a PT
- 300,000 monthly page impressions

Still, this tactic doesn't always work for three simple reasons:

1. Not all websites have “advertise with us” pages;
2. Traffic stats aren’t always published on them;
3. Traffic numbers aren’t always up-to-date

If you do find an “advertise with us” page with traffic stats, always try to check if they’re up to date.

Most websites will list when they were last updated...

Statistics As Of March 2017

- **Monthly Sessions: 858,651**
- **Monthly Page Views: 1,437,790**
- **Email Subscribers: 24,000**
- **Google Domain Authority: 43**
- **Page Authority: 52**
- **Alexa Rank: 77,584**
- **Alexa Rank USA: 18,304**

example from TravelFashionGirl.com (<http://travelfashiongirl.com/advertise/>)

... but some don’t.

For example, the traffic stats shown on the *geekwire.com* advertising page haven’t been updated for at least a year.

225

1259

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

If the website hasn't updated their traffic stats recently (or simply fails to give a "last updated" date), don't trust the numbers; they're unlikely to be accurate.

Method 3. Ask!

If you want to know accurate, up-to-date traffic statistics for a website, you'll need to get in touch (<https://ahrefs.com/blog/find-email-address/>) with the owner and ask them directly.

But most bloggers aren't going to give out that information to a complete stranger, right?

You'd be surprised. Many bloggers are perfectly willing to share this data with those with a genuine reason for asking, such as:

1. You're interested in buying their website.
2. You want to advertise on their site;

Here's an example email that I've used in the past when trying to find out traffic statistics:

Sent Initial email Apr 11, 2017 6:49 pm

VIEW 

From: [REDACTED]
Subject: Advertising Enquiry

Hey,

I'm looking to enquire about advertising on your site ([REDACTED].com).

Could you let me know the different advertising options you offer? I'm particularly interested in native advertising (i.e. 'sponsored posts') if you offer them?

My budget is \$200-\$1000.

Could you also let me know how many unique visitors and pageviews the site gets each month? (March 2017 stats would be best if you have them) — your advertising page stated 20000 unique visitors per month; is this still accurate?

Thanks for your time,
Richard

SIDENOTE. We don't advise sending emails like this unless you're genuinely looking for advertising opportunities. Don't waste people's time!

Like I said, most bloggers will be happy to share up-to-date traffic numbers with genuine advertisers. Many will even screenshot Google Analytics data as proof.

While this method is typically the most reliable way to decipher traffic stats, it's not 100% foolproof. Here's why:

Some bloggers/webmasters will fabricate traffic stats in order to sell advertising;

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Not everyone has Google Analytics installed. Many will rely on less than accurate analytics platforms (e.g., WordPress plugins) for their data; Google Analytics can be easily misinstalled, meaning that data isn't always accurate. If reported traffic sounds too high, try checking their website for duplicate GA code. Alternatively, ask them what their bounce rate is; a super-low bounce rate is often a good indicator of duplicate GA code.

So even if do reach out to the blogger and get those elusive traffic stats, we would still recommend verifying their legitimacy with third-party tools.

Here are a few more tips for estimating website traffic...

Estimated traffic stats are a good starting point, but you can tell a lot about the popularity of a website by manually checking a few things, such as:

- # of comments on their posts (on average);
- # of YouTube video views;
- # of social shares;
- Engagement levels on their fan pages (i.e., Facebook page, Twitter, etc.)

If you take a look at the Ahrefs blog (<https://ahrefs.com/blog/>), for example, you'll see that virtually every blog post has a good number of comments.

Find Out How Much Traffic a Website Gets: 3 Ways Compared

Most readers don't bother leaving a comment, no matter how great the content happens to be. So a blog that receives a consistently high number of comments will almost certainly be getting a significant amount of traffic.

SIDENOTE. I'd also recommend checking the quality of comments when using this tactic; sometimes high comment counts are due to a site being spammed.

"Social shares" can be another indication of high traffic.

For example, if we check the **Top Content** report for *ahrefs.com* in Site Explorer (<https://ahrefs.com/site-explorer>), we can see that most of the posts on Ahrefs' blog receive tons of social shares.

And finally, there's YouTube...

All our videos on YouTube

(https://www.youtube.com/channel/UCWquNQV8Y0_defMKnGKrFOQ/videos?flow=grid&sort=p&view=0) have hundreds or thousands of views.

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

If this amount of people are watching our YouTube videos, well, it's probably safe to say that a fair few are visiting our site too.

Final thoughts

Traffic estimation tools aren't perfect. However, they do offer by far the quickest way to estimate traffic to sites you don't own.

If you need accurate numbers, you'll have to ask directly; there are no two ways about it.

Do you know of any other reliable ways to estimate/find website traffic stats? Let us know.

Great article, Joshua.

My experience is similar. Working with hundreds websites, I found that Ahrefs underestimates organic traffic even by 90% comparing to GA, Search Console and Kissmetrics. But most of time Ahrefs underestimates website traffic by 40-50%.

But still, it is No. 1 tool to uncover data from yours and competitor traffic.

Similarweb is good to compare traffic sources and that's it.

Maybe, for fairly analysis, it's worth-to-try comparing Ahrefs and Semrush. My favorite is still Ahrefs but I could be more equal.

Deborah Kay • a year ago

Great guide! FYI I paid ~10K USD a year for SimilarWeb PRO in 2016! Discontinued because it was too expensive and too inaccurate. Will explore Ahref soon!

@Joshua Hardwick Awesome Guide! Always love reading your content.

I have always preferred using SimilarWeb for attaining the traffic stats and found the data to be averagely accurate and useful.

Great Content! Waiting to read more by you :)

Website Traffic Estimation!!

your article is on Prevailing Content as your every article are.

I would like to add Alexa here. because I found cushy statistical information about Traffic with Alexa.

Thanks, Joshua and Team! :)

2 [^](#) [v](#) • Reply • Share >

Joshua Hardwick Mod → Vijay Lathiya • a year ago

thanks, Vijay! we actually tested Alexa a couple of years ago and found that it wasn't as good as Similarweb, hence the reason we left it out. It really does depend on your sample though - there are of course times where Alexa will be more accurate than Similarweb, and vice-versa.

im sorry but i think its more like a promotional content rather than informational.

1 [^](#) [v](#) • Reply • Share >

getivan.com • 3 days ago

Self-Promotion should be the last thing you do, and this entire post is basically self-promotion.

No actual insight into how traffic is measured by third-party, and that's the whole point.

9/24/2019

Find Out How Much Traffic a Website Gets: 3 Ways Compared

You didn't even mention competitors, or give reasons to use your product over others.

Low Quality Content.

Google Analytics is absolutely horrible, relying on Javascript it undercounts site traffic tremendously.

My DNS provider and my servers tell a far different story, and Similarweb is always closer than Google.
